

Webinar FAO/Agreenium/UN-ESCAP October 28, 2020

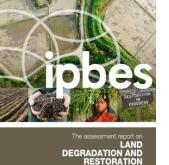

Preventing and mitigating land degradation: nutrient turnover and terrestrial carbon sequestration

Agricultural and forestry strategies to prevent and mitigate land degradation, with a special focus on nutrient turnover and carbon sequestration

Dr. Julien Demenois (Cirad)

- 1. What is land degradation? What is the extent of land degradation and what are the challenges?
- 2. Potential strategies in agriculture and forestry to prevent and mitigate land degradation
- 3. A focus on agroforestry in DR Congo to contribute positively to nutrient turnover and carbon sequestration

What is land degradation ?

Land degradation

Refers to the many processes that drive the **decline or loss in biodiversity**, **ecosystem functions or services** and includes the degradation of **all terrestrial ecosystems**. (IPBES, 2019)

Biodiversity

ipbes

The **variability** among living organisms from all sources including, terrestrial, marine and other aquatic ecosystems and the ecological complexes of which they are part; this includes **diversity within species, between species and of ecosystems**. (IPBES, 2019)

Ecosystem function(s)

The flow of energy and materials through the biotic and abiotic components of an ecosystem. It includes many processes such as **biomass production**, trophic transfer through plants and animals, **nutrient cycling**, water dynamics and heat transfer. (IPBES, 2019)

Ecosystem services

The benefits **people** obtain from ecosystems. In the Millennium Ecosystem Assessment, ecosystem services can be divided into **supporting, regulating, provisioning and cultural**. (IPBES, 2019)

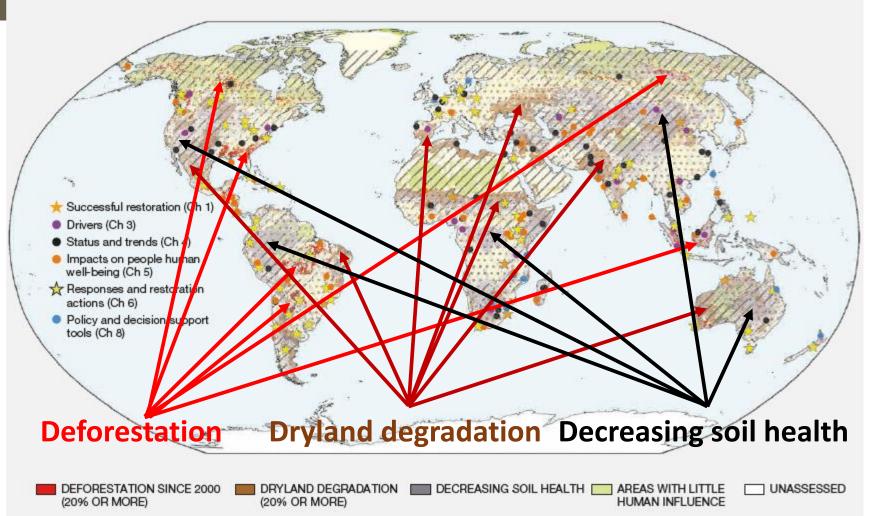

The assessment report on LAND DEGRADATION AND RESTORATION

What is the extent of land degradation and what are the challenges ?

Land degradation is a pervasive, systemic phenomenon: it occurs in all parts of the terrestrial world and can take many forms. (IPBES, 2019)

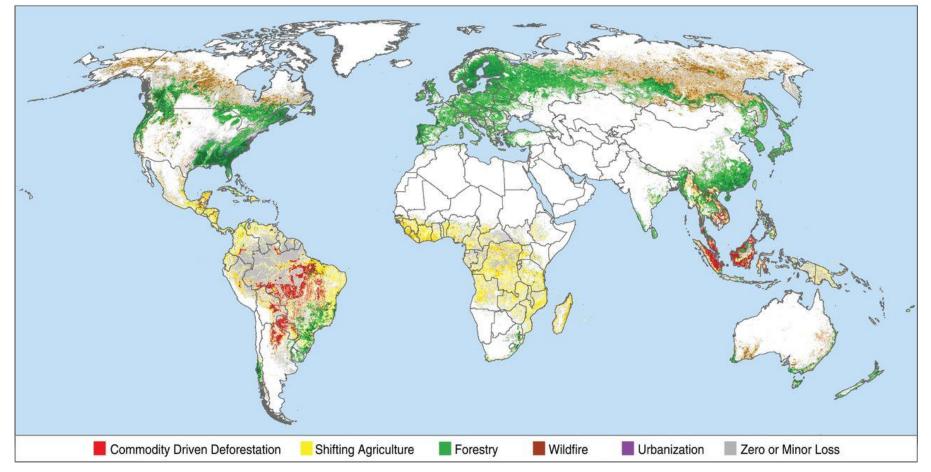

NO AGREEMENT COME AGREEMENT IN HIGH AGREEMENT

Forest degradation and deforestation

- rate of deforestation since 2001 : 5 Mha year⁻¹
- 1.5 GtC/year (Global Carbon Budget 2019)
- 14 % of CO₂ emissions

Primary drivers of forest cover loss for the period 2001 to 2015

Philip G. Curtis et al. Science 2018;361:1108-1111

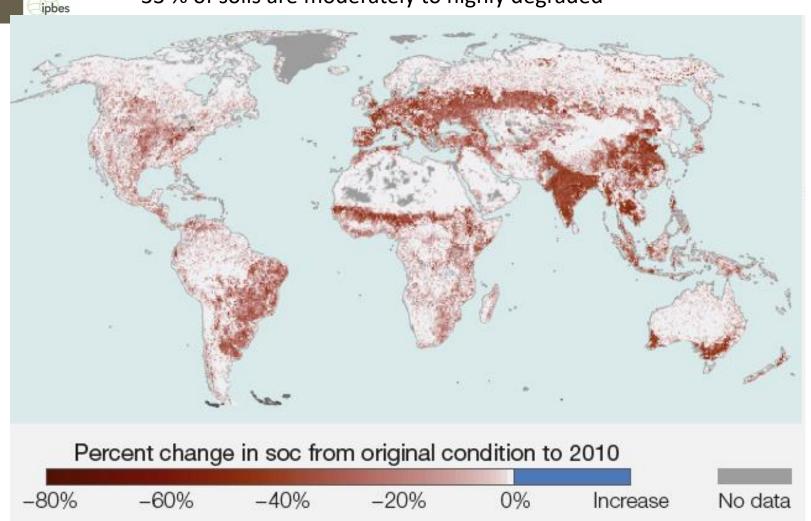

LAND DEGRADATION AND RESTORATION

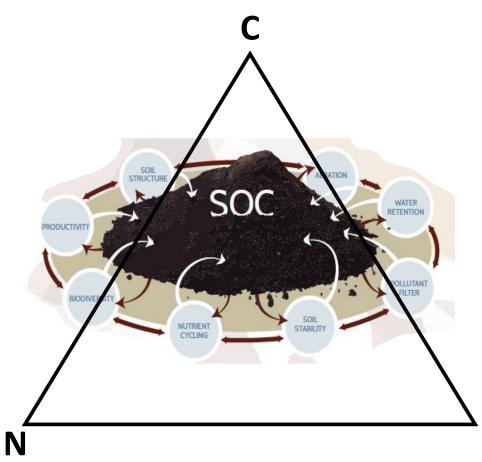

Soil health degradation

Change in Soil Organic Carbon (SOC) :

- 8 % loss over the two last centuries
- 176 GtC released
- 33 % of soils are moderately to highly degraded

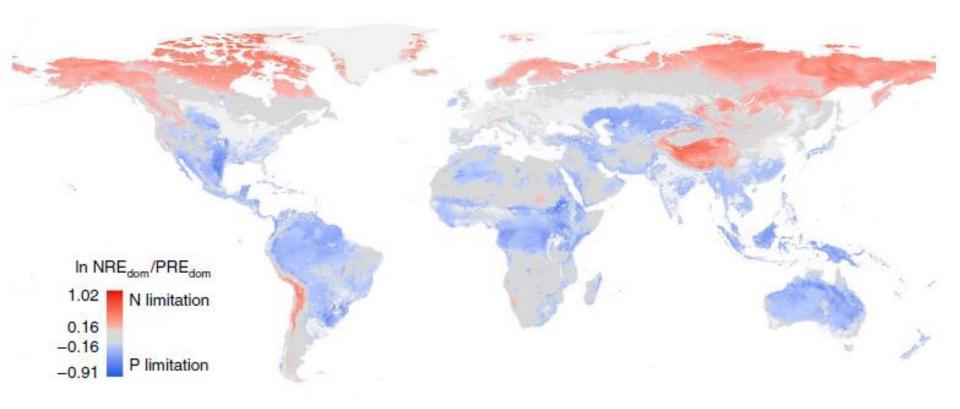

SOC, N and P linkages

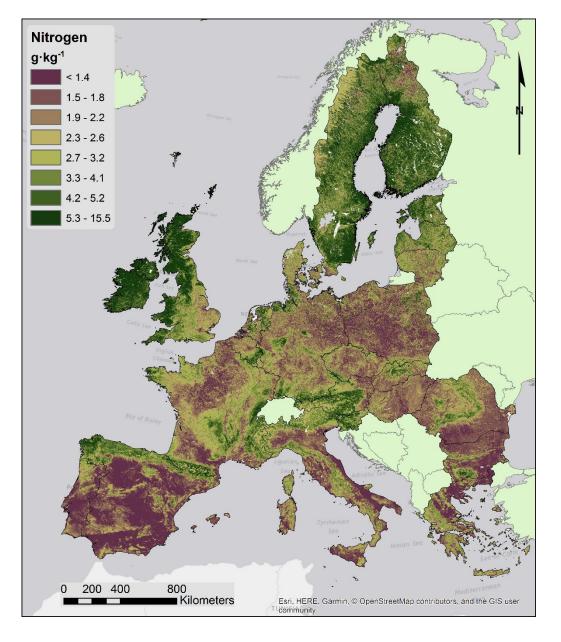

- Carbon is the main component (more than 58%) of soil organic matter (SOM)
- C is strongly coupled to nutrients such as N and P
- N and P show constant ratios to C in a wide range of global soils
- The availability of nutrients, in particular N and P, is needed to achieve SOC stock increases
 P

N and P limitations of terrestrial C uptake

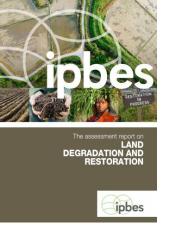

- 18 % of natural terrestrial land area is limited by N
- 43 % of natural terrestrial land area is limited by P

N in Europe

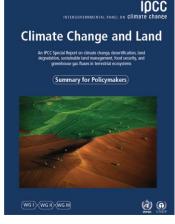

- N leaching
- Eutrophication of aquatic ecosystems

JRC, 2019

What is the extent of land degradation and what are the challenges ?

- The well-being of (at least) 3.2 billion people negatively impacted by land degradation
- Land degradation costs more than 10 per cent of the annual global gross product in loss of biodiversity and ecosystem services
- **Climate change exacerbates land degradation**, particularly in low-lying coastal areas, river deltas, drylands and in permafrost areas (high confidence).
- The impact of almost all direct drivers of land degradation will be worsened by climate change. These include, among others, accelerated soil erosion on degraded lands as a result of more extreme weather events, increased risk of forest fires and changes in the distribution of invasive species, pests and pathogens.

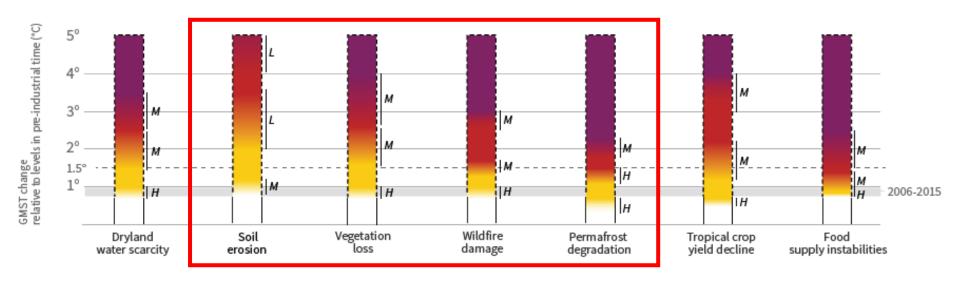

Climate Change and Land An IPCC Special Report on climate change, desertification, land degradation, sustainable land management, food security, and

Summary for Policymakers

Climate change and land degradation

Land degradation

IPCC, 2019

The Phosphorus challenge exacerbated by climate change

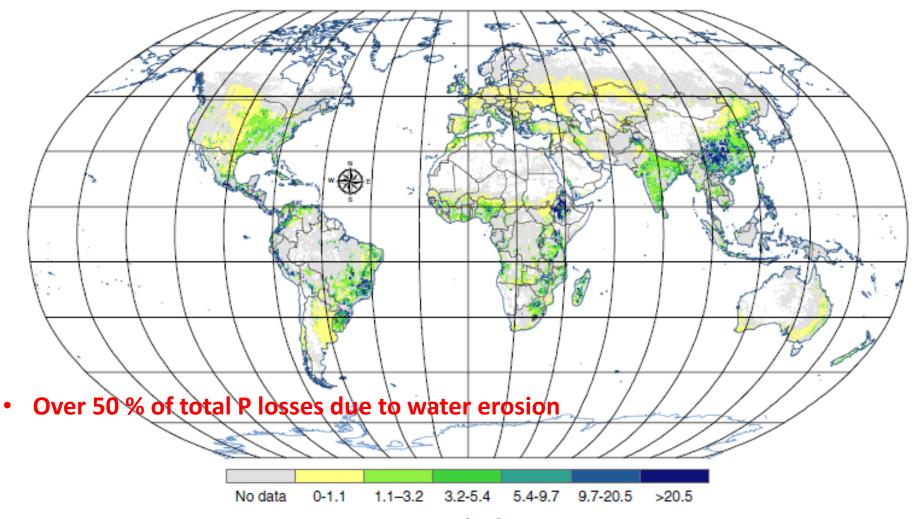

Fig. 2 Global average phosphorus (P) losses due to soil erosion in kg ha⁻¹ yr⁻¹. The chromatic scale represents the P losses estimates, while the gray color indicates the cropland areas that were excluded from the modeling due to data unavailability. Note that classes are not regularly scale ranked but are divided into six classes using the quantile classification method. Only plant available fractions were considered. For the more residual P fractions please refer to Table 1 or Figs. 3 and 4).

Alewell et al., 2020

How to increase soil organic carbon?

 Increase C inputs in soil

Agroforestry

Integrated management of soil fertility

Pasture management and grazing lands

Organic fertilizers

Agroecology

No tillage

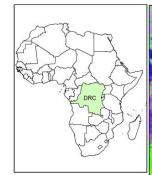

Conservation agriculture

 Decrease C outputs through mineralization and C exports

Fire management

Erosion control

riangle Savannah

Herbaceous savannah
River valleys covered by gallery forest
Mampu agroforestry system

CIRAD-ES, UR Forests and Societies Source : Landsat 2010 N. Fauvet, May 2017 1 250 2 500

Dubiez et al, 2018

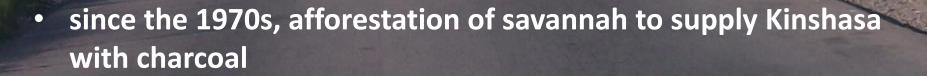

- altitude : ~ 700 m asl
- annual rainfall : ~ 1,500 mm
- Ferralic Arenosols : sandy, acidic, chemically very poor
- gramineous savannah with low tree density

savannah periodically burned to support hunting practices
shifting cultivation traditionally in gallery forests
mechanized farming in savannah since the introduction of tractors

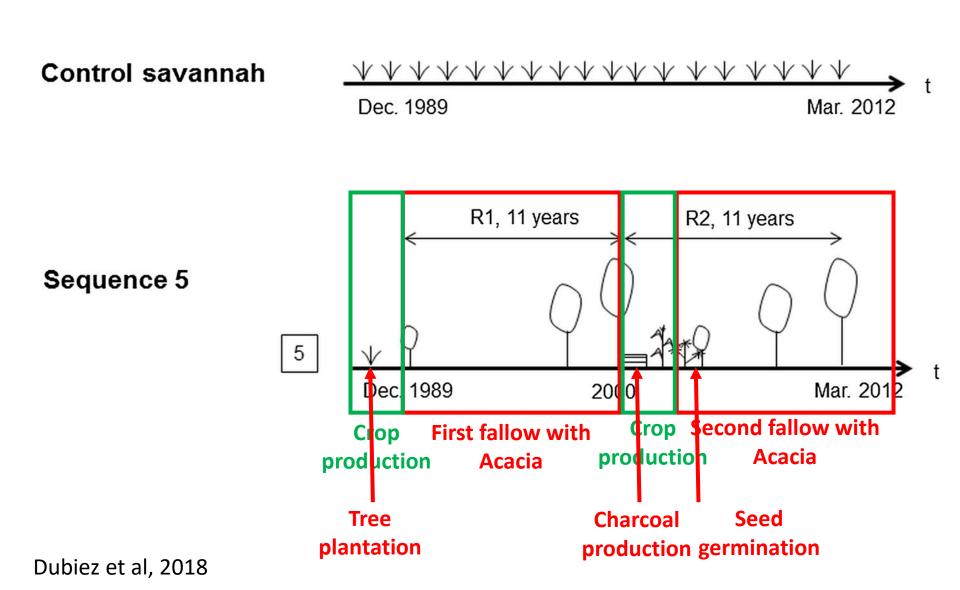

Agroforestry system = rotational woodlot • Alternate a phase of food crop production with a phase of fallow planted with N₂ fixing trees

•

Cassava or maize production Burning of slash residues (leaves, branches, bark) Application of ashes of charcoal

Charcoal production on-site after Acacia rotation

Sequences	Density (N ha ⁻¹)		AGB (mg ha ⁻¹	Basal area (m ² ha ⁻¹)	Mean height (m)
1 (22 years)	239 ± 49	afforestation	83.1 ± 31.6	12.6 ± 3.8	14.9 ± 2.2
2 (1-2 years)	1933 ± 1492		6.2 ± 4.8	2.2 ± 1.7	3.7 ± 1.0

Ways to limit nutrient loss :

- Debark trees on-site before carbonization => Ca inputs
- Return part of the charcoal to the soil => increase pH, decrease Al saturation
- Increase the restitution of leaves, twigs, small branches
- Limestone amendments to increase pH and exchangeable Ca

SOC in agroforestry systems
